Tips:

- It may be necessary to alter the running speeds from those shown in the speed chart in order to achieve optimum performance.
- Harder materials require slower running speeds.
- Smaller burrs require faster running speed
- Long shank burrs require slower speeds for safety reasons
- Long shank and customized are all available.
- Apply constant movement and light pressure when using the burr.
- Running above optimum speed will cause premature tooth wear
- Allowing the burr to become too hot may cause the braze to soften, and cause the head to become detached from the shank
- Using tools and collects which have become worn will encourage chipping
- Do not sink the burr for more than one third of its periphery.

Always think safe!
